

## Natural changes of population\* 1961 – 1997

Profile  
July 2020

### Peć

	1961	1997
Population size	66846	141400
Livebirths, Number	2715	2426
Deaths, Number	738	545
Natural increase, Number	1977	1881
Infants deaths, Number	301	20
Livebirths, per 1,000 population	41	17
Deaths, per 1,000 population	11	4
Natural increase, per 1,000 population	30	13
Infants deaths, per 1,000 livebirths	111	8

## Definitions

### Population size

Number of population in the respective year. The data on the number of population in 1961, 1971, 1981 and 1991 are census data, while for the inter-census years the number of population was calculated as an average inter-census difference.

### Livebirths

Absolute number of live births in the course of a year. Live born child means a child giving vital signs after birth (breathing, i.e. heartbeat), even for the shortest time, regardless the mother's pregnancy duration.

### Deaths

Absolute number of deaths in the course of a year. Deceased is a person that whenever after having been born live, shows permanently stopped vital signs.

### Natural increase

Natural population increase is the number of live births minus the number of deaths.

### Infants deaths

Absolute number of infants deaths in the course of a year. Deceased infant is a child that after having been born live and before aged one year, shows permanently stopped vital signs.

### Livebirths, per 1 000 population

Livebirths rate is the ratio of the number of live births and the population size in the respective year. The number of live births is divided by the population size and then multiplied by 1000.

### Deaths, per 1 000 population

General mortality rate represents the ratio between the number of deaths and the population size in the respective year. The number of deaths is divided by population size and then multiplied by 1000.

### Natural increase, per 1 000 population

Natural population increase rate is the difference between the number of live births and the number of deaths, in relation to the population size in the respective year.

$$\text{Natural population increase rate} = (\text{number of live births} - \text{number of deaths}) / \text{population size} * 1000$$

### Infants deaths, per 1 000 livebirths

Infant mortality rate is the ratio of deceased children under 1 year of age and live births in the respective year. The mortality rate is expressed per 1000 live births.

$$\text{Infant mortality rate} = (\text{number of deceased children under 1 year of age} / \text{number of live births}) * 1000$$
